#### CHAPTER 7

## **SORTING**

All the programs in this file are selected from

Ellis Horowitz, Sartaj Sahni, and Susan Anderson-Freed "Fundamentals of Data Structures in C",

CHAPTER 7

# Sequential Search

- •Example 44, 55, 12, 42, 94, 18, 06, 67
- Unsuccessful search
  - n+1
- Successful search

$$\sum_{i=0}^{n-1} (i+1) / n = \frac{n+1}{2}$$

```
# define MAX-SIZE 1000 /* maximum size of list plus one */
typedef struct {
    int key;
    /* other fields */
    } element;
element list[MAX_SIZE];
```

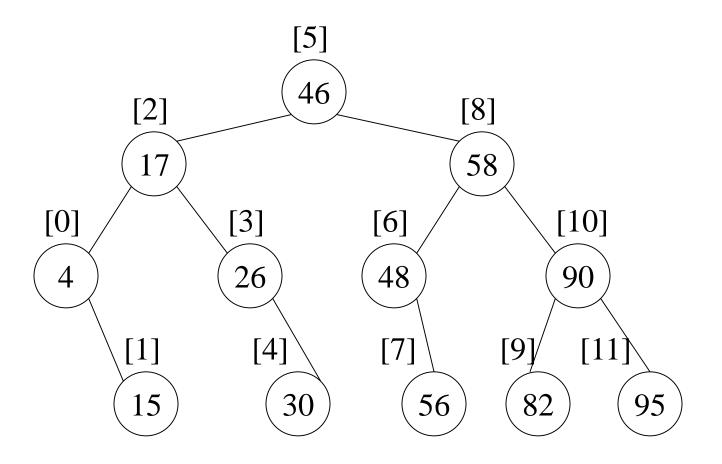

CHAPTER 7

## \*Program 7.1:Sequential search

```
int seqSearch(element a[], int k, int n)
 /* 在a[1:n]中尋找最小的i值,使得a[i].key = k
   如果k在串列中找不到,則回傳0。*/
  int i;
 for(i=1; i<=n && a[i].key !=k; i++)
  if (i>n) return 0;
  return i;
```

CHAPTER 7

```
*Program: Binary search
int binsearch(element list[], int searchnum, int n)
/* search list [0], ..., list[n-1]*/
  int left = 0, right = n-1, middle;
  while (left <= right) {
     middle = (left + right)/2;
  switch (COMPARE(list[middle].key, searchnum)) {
     case -1: left = middle +1; //go to right
             break;
     case 0: return middle;
     case 1:right = middle - 1; //go to left
            break;
                                          O(\log_2 n)
    return -1;
```

4, 15, 17, 26, 30, 46, 48, 56, 58, 82, 90, 95

\*Figure 7.1:Decision tree for binary search

# List Verification

- Compare lists to verify that they are identical or identify the discrepancies.
- Example
  - International revenue service (e.g., employee vs. employer)
  - List1 is the employer list; List2 is the employee list.
  - Various employers stating how much they paid their employees;
  - Individual employees stating how much they received.
- Complexities
  - random order: O(mn)
  - ordered list:

```
O(tsort(n)+tsort(m)+m+n)
```

#### \*Program 7.2: verifying using a sequential search

```
void verify1(element list1[], element list2[], int n, int m)
/* compare two unordered lists list1 and list2 */
                                     (a) all records found in list1 but not in list2
int i, j;
                                     (b) all records found in list2 but not in list1
int marked[MAX SIZE];
                                     (c) all records that are in list1 and list2 with
                                        the same key but have different values
for(i = 0; i < m; i++)
                                        for different fields.
 marked[i] = FALSE;
for (i=0; i<n; i++)
 if ((i = seqsearch(list2, m, list1[i].key)) == 0)
   printf("%d is not in list 2\n ", list1[i].key);
else
/* check each of the other fields from list1[i] and list2[j], and
print out any discrepancies */
```

```
marked[j] = TRUE;
for ( i=0; i<m; i++)
    if (!marked[i])
       printf("%d is not in list1\n", list2[i].key);
}</pre>
```

```
*Program 7.3:Fast verification of two lists (p.325)
void verify2(element list1[], element list2[], int n, int m)
/* Same task as verify1, but list1 and list2 are sorted */
  int i, j;
  sort(list1, n);
  sort(list2, m);
 i = j = 0;
 while (i < n && j < m)
     if (list1[i].key < list2[j].key) {
        printf ("%d is not in list 2 \n", list1[i].key);
        i++; //fixed j, control i
     else if (list1[i].key == list2[j].key) {
    /* compare list1[i] and list2[j] on each of the other field
       and report any discrepancies */
     i++; j++;
```

```
else {
    printf("%d is not in list 1\n", list2[j].key);
    j++;
}
for(; i < n; i++)
    printf ("%d is not in list 2\n", list1[i].key);
for(; j < m; j++)
    printf("%d is not in list 1\n", list2[j].key);
}</pre>
```

CHAPTER 7

# Sorting Problem

#### • Definition

#### R: record K: key value

- given  $(R_0, R_1, ..., R_{n-1})$ , where  $R_i = \text{key} + \text{data}$  find a permutation  $\sigma$ , such that  $K_{\sigma(i-1)} \le K_{\sigma(i)}$ , 0 < i < n-1
- Sorted
  - $K_{\sigma(i-1)} \le K_{\sigma(i)}$ , 0 < i < n-1
- Stable
  - if i < j and  $K_i = K_j$  then  $R_i$  precedes  $R_j$  in the sorted list
- internal sort vs. external sort
- Criteria
  - # of key comparisons
  - # of data movements

# **Insertion Sort**

#### Find an element smaller than K.

|    | •  |    |    |    |    |    |    |    |    |
|----|----|----|----|----|----|----|----|----|----|

# **Insertion Sort**

```
void insert(element e, element a[], int i)
{ /* 將e插入到一個已排序過串列 a[1:i] 中,並使得插入過後的串列
a[1:i+1]仍然是依序排好。此陣列a至少必須分配到大小為i+2個
element */
 a[0] = e;
 while (e.key < a[i].key)
    a[i+1] = a[i];
    1--:
a[i+1] = e;
```

```
void insertionSort( element a[], int n)
{     /* 將a[1:n] 排序成依序遞增 */
     int j;
     for ( j =2; j<=n; j++) {
        element temp = a[j];
        insert(temp, a, j-1);
     }
}</pre>
```

- 實作section sort 排序10個數字
- ●實作步驟
- 1. 取得要排序的數字
- 2. 從10個中找出最小值
- 3. 最小值與未排序中的第一個值做交換
- 4. 直到排序完所有值

• 未排序的10個數字

init 40 48 24 55 19 89 82 34 77 51

- 已排序的數字
- 未排序的數字

#### ● 步驟1

#### 找出未排序中的最小值

| 40 48 24 55 <b>19</b> 89 82 34 77 5 |
|-------------------------------------|
|-------------------------------------|

#### 最小值與未排序的第一個值交換

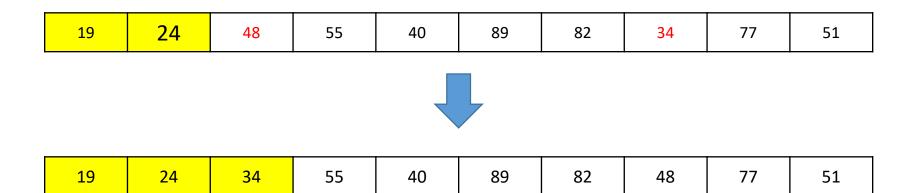

| 19     48     24     55     40     89     82     34     77     51 | 19 | 48 | 48 24 | 55 | 40 | 89 | 82 | 34 | 77 | 51 |
|---|----|----|-------|----|----|----|----|----|----|----|
|---|----|----|-------|----|----|----|----|----|----|----|

#### 把交換後的最小值設為已排序

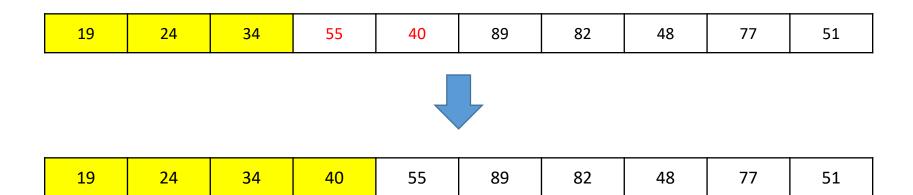

● 步驟2 (48, 24互換)

| 19  | 48 | 24 | 55 | 40 | 89 | 82 | 34 | 77 | 51 |  |  |
|---|----|----|----|----|----|----|----|----|----|--|--|
|   |    |    |    |    |    |    |    |    |    |  |  |
|   |    |    |    |    |    |    |    |    |    |  |  |
| 19     24     48     55     40     89     82     34     77     51 |    |    |    |    |    |    |    |    |    |  |  |

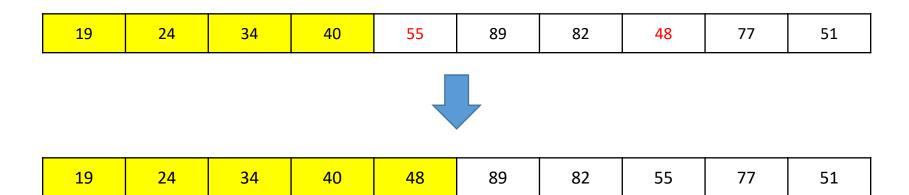

● 步驟3 (48,34互換)

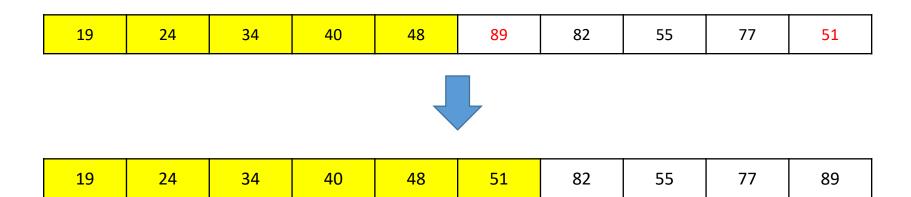

• 步驟4 (55, 40互換)

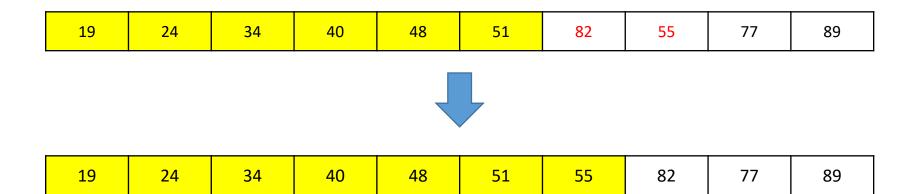

● 步驟5 (55,48互換)

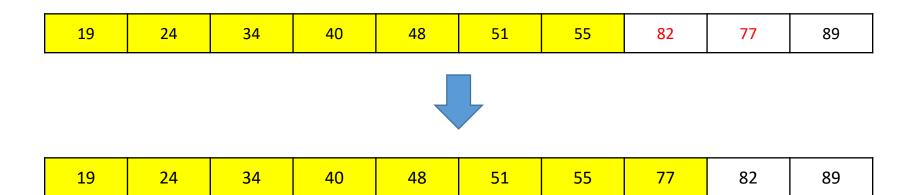

• 步驟6 (89,51互換)

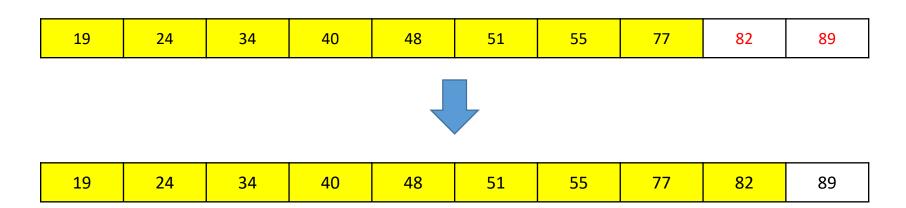

● 步驟7 (82,55互換)

• 步驟8 (82,55互換)

● 步驟9 (82,89不用互換)

●結果

| 19 | 24 | 34 | 40 | 48 | 51 | 55 | 77 | 82 | 89 |
|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |

selectionSort()

```
void selectionSort( int array[], int length ){
  int smallest; /* index of smallest element */
  int i, j; /* ints used in for loops */
  /* loop over length - 1 elements */
   for ( i = 0; i < length - 1; i++ ) {
      smallest = i; /* first index of remaining array */
      /* loop to find index of smallest element */
      for (j = i + 1; j < length; j++)
          if ( array[ j ] < array[ smallest ] )</pre>
             smallest = j;
       swap( array, i, smallest ); /* swap smallest element */
       printPass( array, length, i + 1, smallest ); /* output pass */
```

#### worse case

| i | 0 | 1 | 2 | 3 | 4   |
|---|---|---|---|---|---|
| - | 5 | 4 | 3 | 2 | 1   |
| 1 | 4 | 5 | 3 | 2 | $O(\sum_{i=1}^{n-2} i) = O(n^2)$                |
| 2 | 3 | 4 | 5 | 2 | $\int_{1}^{1} O(\sum_{j=0}^{n-2} i) = O(n^{2})$ |
| 3 | 2 | 3 | 4 | 5 | 1   |

### best case

i 0 1 2 3 4 5 1 O(n)
2 2 3 4 5 1 O(n)
2 2 3 4 5 1
4 1 2 3 4 5 1

3

left out of order (LOO)

k: # of records L

# Variation

- Binary insertion sort
  - sequential search --> binary search
  - reduce # of comparisons,# of moves unchanged
- List insertion sort
  - array --> linked list
  - sequential search, move --> 0

# Quick Sort (C.A.R. Hoare)

```
 \begin{split} \bullet & \text{Given } (R_0, R_1, \ldots, R_{n-1}) \\ \bullet & K_i \text{: key} \\ & \text{if } K_i \text{ is placed in } S(i), \\ & \text{then } \quad K_j \leq K_{s(i)} \text{ for } j < S(i), \\ & \quad K_j \geq K_{s(i)} \text{ for } j > S(i). \\ \bullet & R_0, \ldots, R_{S(i)-1}, R_{S(i)} R_{S(i)}, R_{S(i)+1}, \ldots, R_{S(n-1)} \end{split}
```

two partitions

# Example for Quick Sort

#### pivot

| RQ       | R1 | R2    | R3  | R4  | R5 | R6   | R7  | R8   | R9  | left | right |
|----------|----|-------|-----|-----|----|------|-----|------|-----|------|-------|
| $\{(26)$ | 5  | 37    | 1   | 61  | 11 | 59   | 15  | 48   | 19} | 0    | 9     |
| { 11     | 5  | .19   | 1   | 15} | 26 | { 59 | 61  | 48   | 37} | 0    | 4     |
| $\{(1)$  | 5} | pivot | {19 | 15} | 26 | { 59 | 61  | 48   | 37} | 0    | 1     |
| 1        | 5  | 11    | 15  | 19  | 26 | { 59 | 61  | 48   | 37  | 3    | 4     |
| 1        | 5  | 11    | 15  | 19  | 26 | { 48 | 37} | 59 { | 61} | 6    | 9     |
| 1        | 5  | 11    | 15  | 19  | 26 | 37   | 48  | 59 { | 61} | 6    | 7     |
| 1        | 5  | 11    | 15  | 19  | 26 | 37   | 48  | 59   | 61  | 9    | 9     |
| 1        | 5  | 11    | 15  | 19  | 26 | 37   | 48  | 59   | 61  |      |       |

# Quick Sort

```
void quicksort(element list[], int left,int right)
  int pivot, i, j;
  element temp;
  if (left < right) {</pre>
    i = left; j = right+1;
    pivot = list[left].key;
    do {
      do i++; while (list[i].key < pivot);</pre>
      do j--; while (list[j].key > pivot);
      if (i < j) SWAP(list[i], list[j], temp);</pre>
    } while (i < j);</pre>
 //exchange the number between groups using pivot
    SWAP(list[left], list[j], temp);
    quicksort(list, left, j-1);
    quicksort(list, j+1, right);
```

# Analysis

- Assume that each time a record is positioned, the list is divided into the rough same size of two parts.
- $\square$  Position a list with *n* element needs O(n)
- $\Box T(n)$  is the time taken to sort n elements

$$T(n) <= cn+2T(n/2)$$
 for some  $c$   
 $<= cn+2(cn/2+2T(n/4))$ 

T(n) <= cn + 2T(n/2)

• • •

 $<=cn\log n+nT(1)=O(n\log n)$ 

# Recurrence Solving: Review

- T(n) = 2T(n/2) + cn, with T(1) = 1.
- By term expansion.

$$\begin{array}{rcl} T(n) & = & 2T(n/2) \, + \, cn \\ \\ & = & 2\left(2T(n/2^2) + cn/2\right) + cn \, = \, 2^2T(n/2^2) \, + \, 2cn \\ \\ & = & 2^2\left(2T(n/2^3) + cn/2^2\right) + 2cn \, = \, 2^3T(n/2^3) \, + \, 3cn \end{array}$$

- Set  $i = \log_2 n$ . Use T(1) = 1.
- We get  $T(n) = n + cn(\log n) = O(n \log n)$ .

# Time and Space for Quick Sort

- Space complexity:
  - Average case and best case:  $O(\log n)$
  - Worst case: O(n)
- ☐ Time complexity:
  - Average case and best case:  $O(n \log n)$
  - Worst case:  $O(n^2)$

# **Quick Sort**

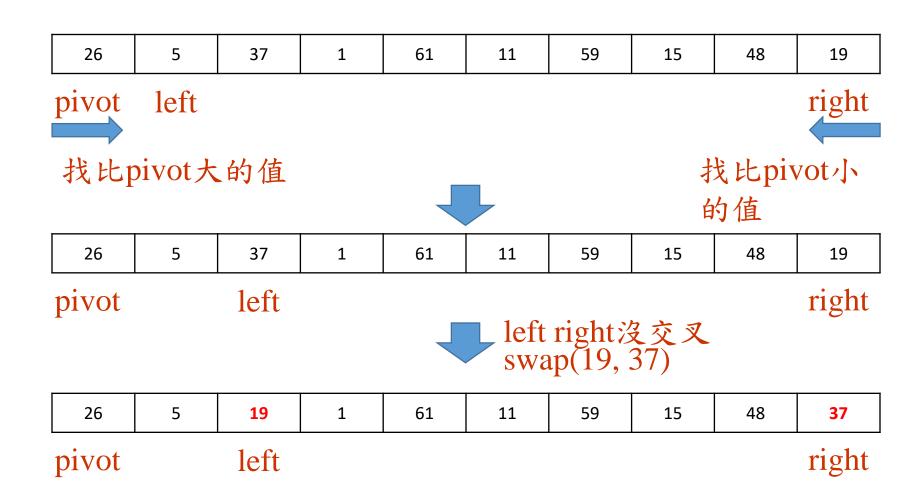

- •實作quick sort排序10個數字
- ●實作步驟
- 1. 取得要排序的數字
- 2. 設left為pivot
- 3. 從left開始找出比pivot大的值
- 4. 從right開始找出比pivot小的值
- 5. 把3,4步驟找到的值交換
- 6. 重複2~5直到排序完成

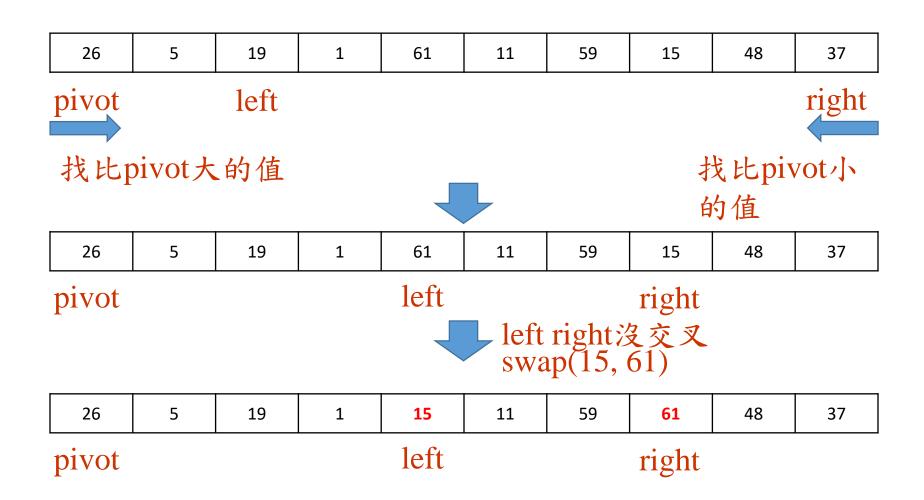

• 未排序的10個數字

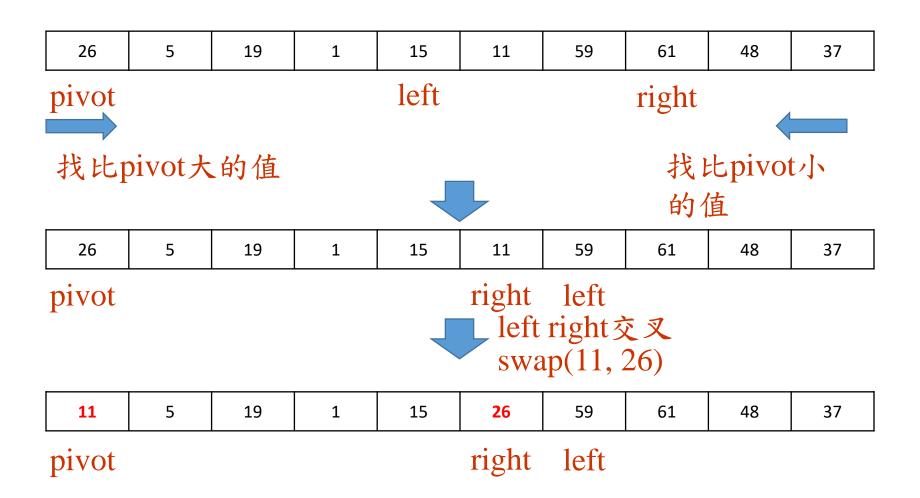

| init 26 5 37 | 1 | 61 | 11 | 59 | 15 | 48 | 19 |
|--------------|---|----|----|----|----|----|----|
|--------------|---|----|----|----|----|----|----|

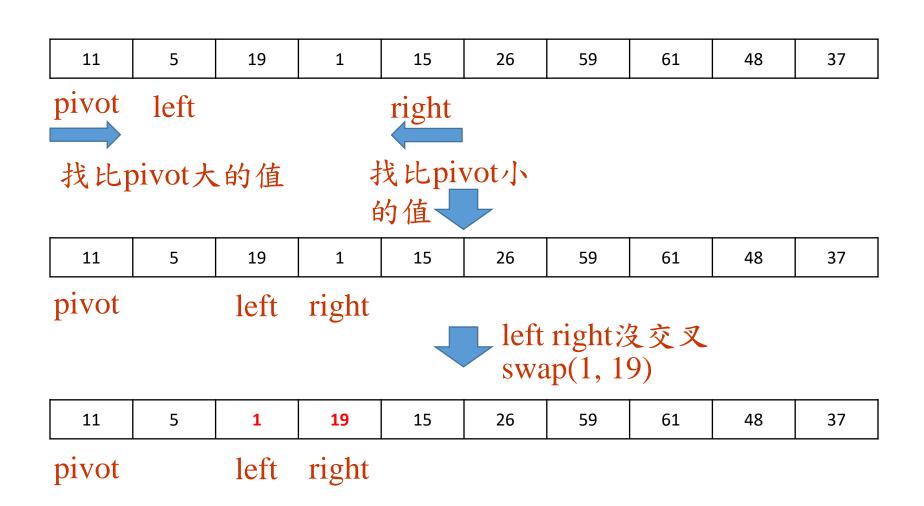

- 已排序的數字
- 未排序的數字

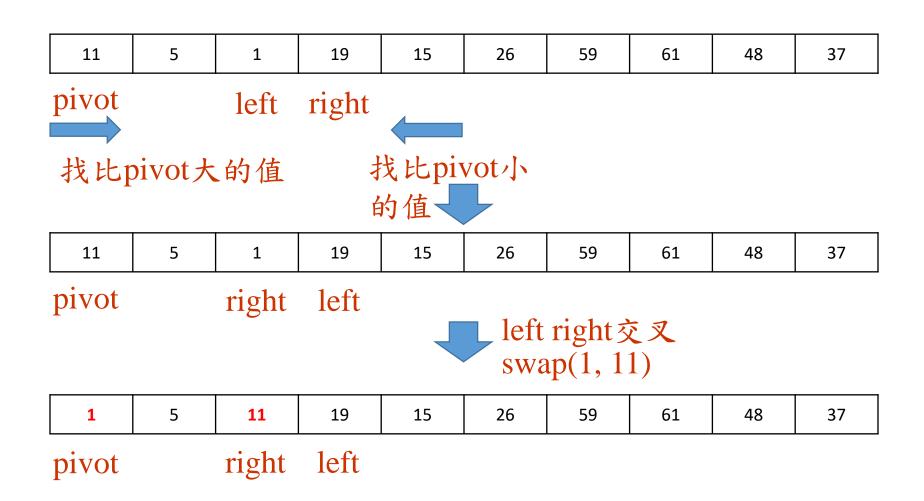

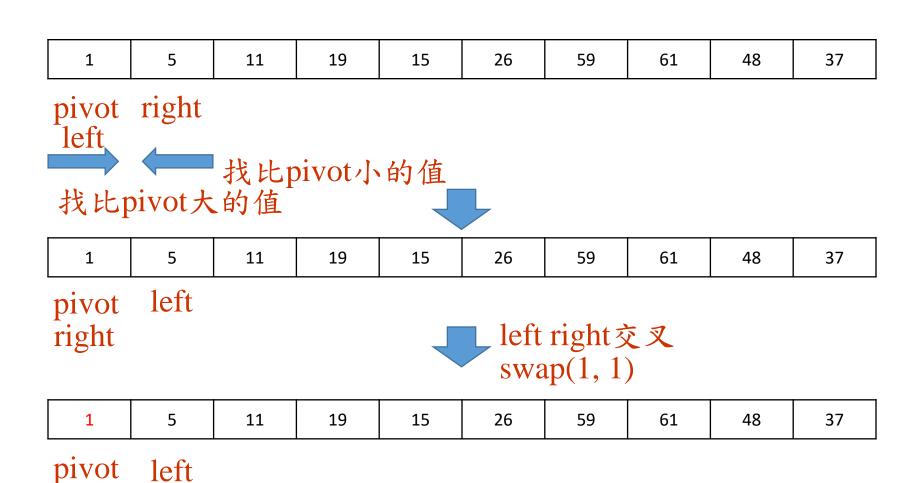

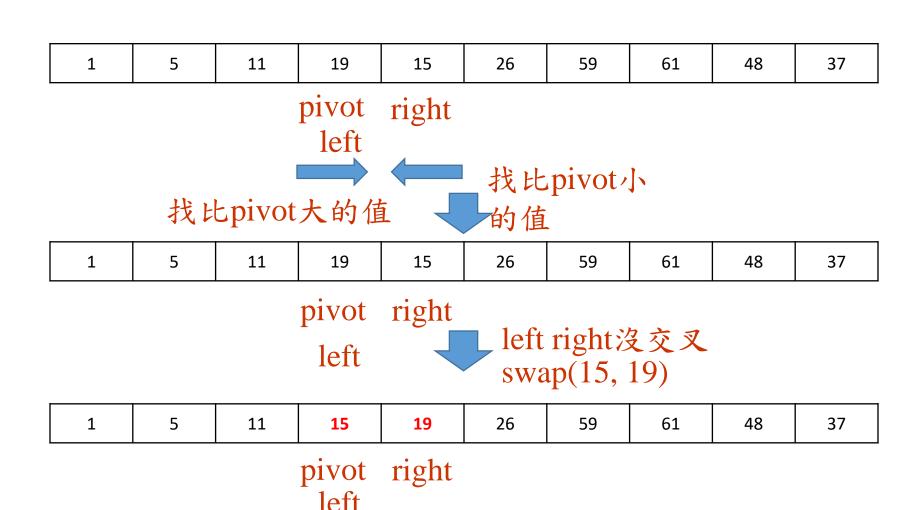

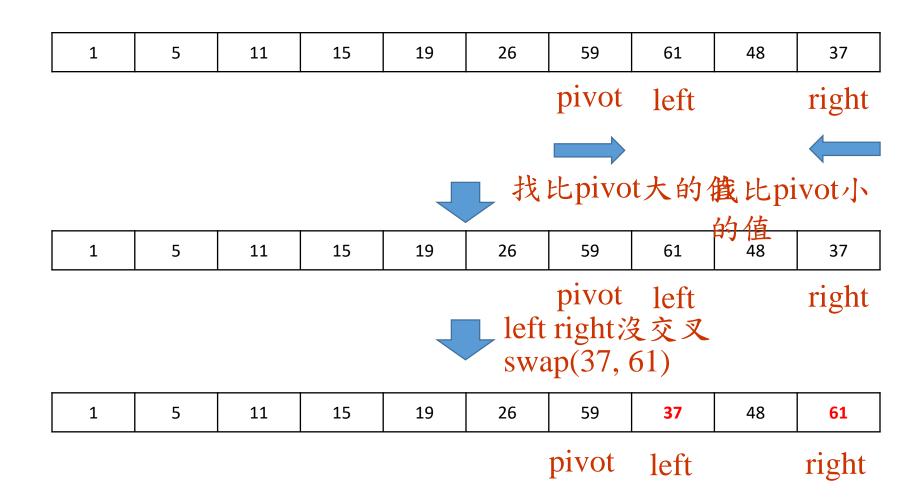

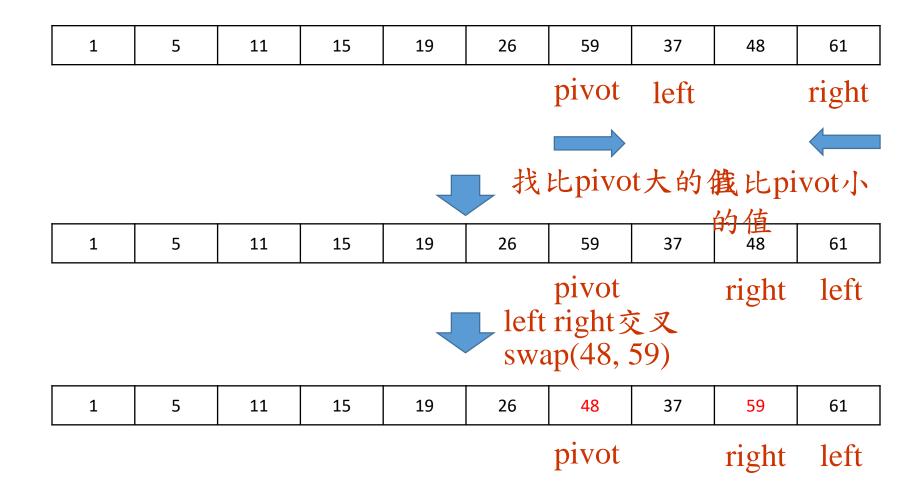

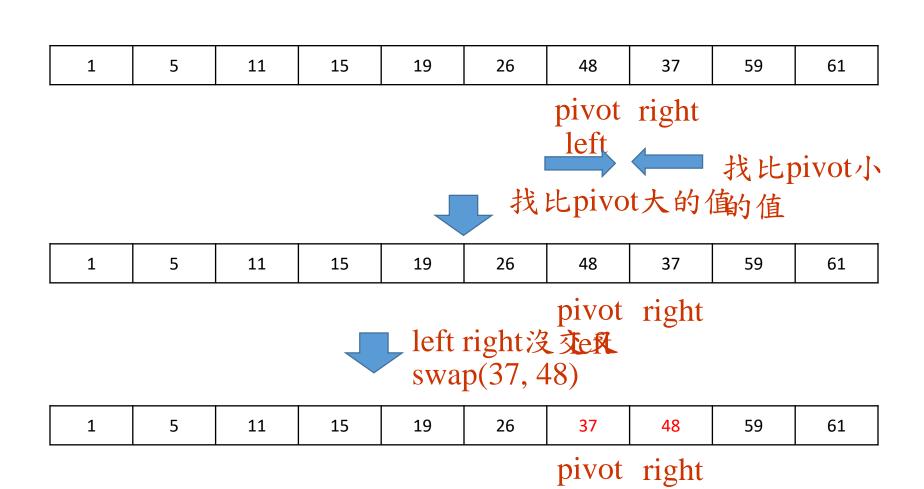

left

```
void quicksort(element a[], int left, int right){
   int pivot, i, j;
   element temp;
   if(left < right){</pre>
       i = left;
       j = right + 1;
       pivot = a[left].key;
       // until the left and right boundaries cross or meet
       do{
            // search value from left side until a[i].key > pivot
            do
                i++;
            while(a[i].key < pivot);</pre>
            // search value from right side until a[j].key < pivot
            do
                j--;
            while(a[j].key > pivot);
            if (i < j){
                SWAP(a[i], a[j], temp);
        } while(i < j);</pre>
        SWAP(a[left], a[j], temp);
        quicksort(a, left, j-1); // execute quick sort on the left side
        quicksort(a, j+1, right); // execute quick sort on the right side
```

# Merge Sort

Given two sorted lists
(initList[i], ..., initList[m])
(initList[m+1], ..., initList[n])

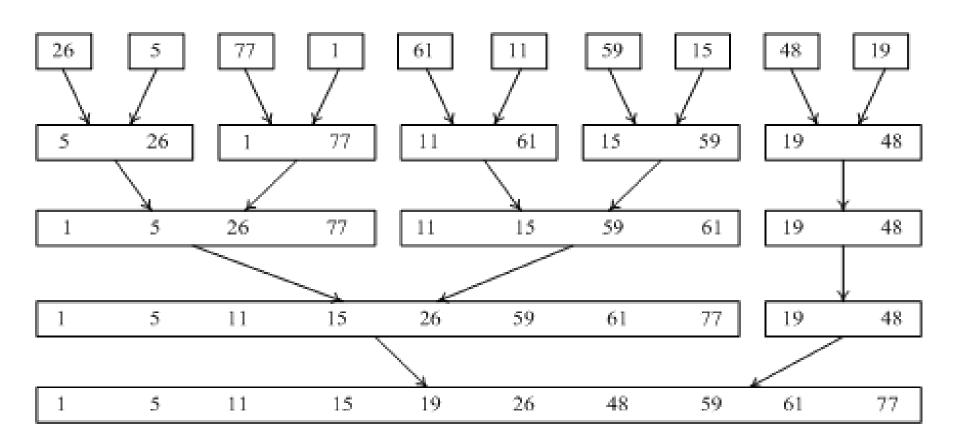

•O(n) space vs. O(1) space Generate a single merge list (mergeList[i], ..., mergeLis[n])

# Merge Sort (O(n) space)

```
void merge(element initList[], element mergeList[]
             int i, int m, int n)
                                       addition space: n-i+1
                                       # of data movements: M(n-
  int j, k, t;
  j = m+1; /*第二個子串列的索引值*/
  k = i; /*合併串列的起始索引值*/
  while (i \le m \&\& j \le n) {
     if (initList[i].key<= initList[j].key)</pre>
         mergeList[k++] = initList[i++];
    else mergeList[k++] = initList[j++];
  if (i>m) /* mergedList[k:n] = initList[j:n] */
    for (t=j; t<=n; t++)
      mergeList [t] = initList[t];
  else for (t=i; t<=m; t++)/* mergedList[k:n] = initList[i:m]
   mergeList[k+t-i] = initList[t];</pre>
```

# Analysis

- array vs. linked list representation
  - array: O(s(n-i+1)) where s: the size of a record for copy
  - linked list representation: O(n-i+1)
     (n-i+1) linked fields

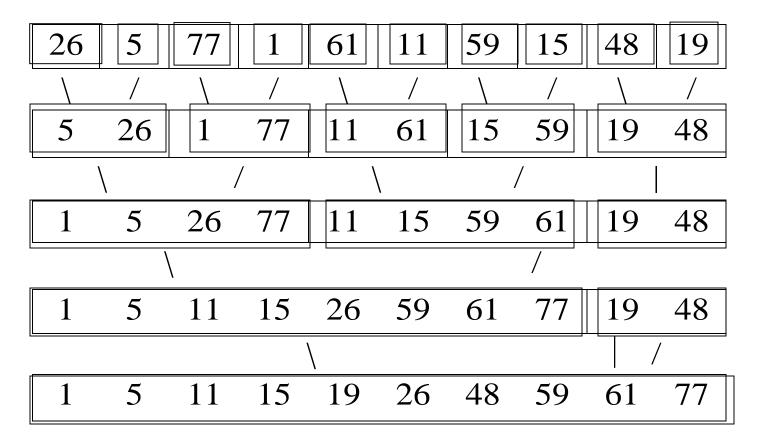

```
void mergePass(element initList[], element
mergedList[], int n, int s)
{/* 執行一回合的合併排序,將initList[]中兩兩相鄰的
排序過的區段合併到mergedList[]。n 為串列中元素個數
,s代表每一個區段大小。 */
                             Two complement segments
  int i, j;
  for( i=1; i \le n - 2 * s + 1; i+= 2*s)
    merge(initList, mergedList, i, i+s-1,
i+2*s-1);
  if (i+s-1 < n) One complement segment and one partial segment
    merge(initList, mergedList, i, i+s-1, n);
  else
    for (j=i; j<=n; j++) Only one segment
          mergedList[j] = initList[j];
                    2*s
```

```
void mergeSort(element a[], int n)
{ /* 使用合併排序法將a[1:n]排序 */
 int s =1; /*現在區段大小*/
 element extra[MAX_SIZE];
 while(s<n) {</pre>
     mergePass(a, extra, n, s);
     s*=2;
     mergePass(extra, a, n, s);
     s*=2;
                              4s
```

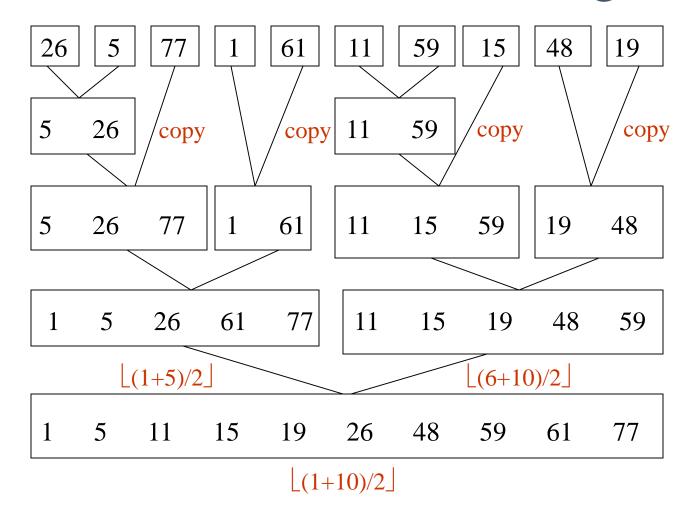

# Interactive Merge Sort

Sort 26, 5, 77, 1, 61, 11, 59, 15, 48, 19

 $O(nlog_2n)$ :  $\lceil log_2n \rceil$  passes, O(n) for each pass

# Recursive Formulation of Merge Sort

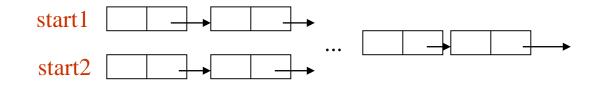

Data Structure: array (copy subfiles) vs. linked list (no copy)

# Recursive Merge Sort

```
left
                                           right
                     Point to the start of sorted chain
int rmergeSort(element a[], int link[],int
  left,int right)
  int mid;
  if (left >= right) return left;
  else {
    mid = (left+right)/2;
    return listMerde(a, link,
                rmergeSort(a,link,left,mid),
                rmerdeSort(a,link,mid+1,right));
          left
                    mid
                                right
```

# ListMerge

```
int listMerge(element a[], int link[], int start1,
                                            int
start2)
 /*兩個排序好的chains分別從start1及start2開始,將它們合併
將link[0]當作一個暫時的標頭。回傳合併好的chains的開頭。*/
int last1, last2, lastResult=0;
lastResult = last1;
                                   element to start
              last1 = link[last1];
                                   and change start
                                   point to first
              link[lastResult]
                           = last2;
              lastResult = last2;
              last2 = link[last2];
```

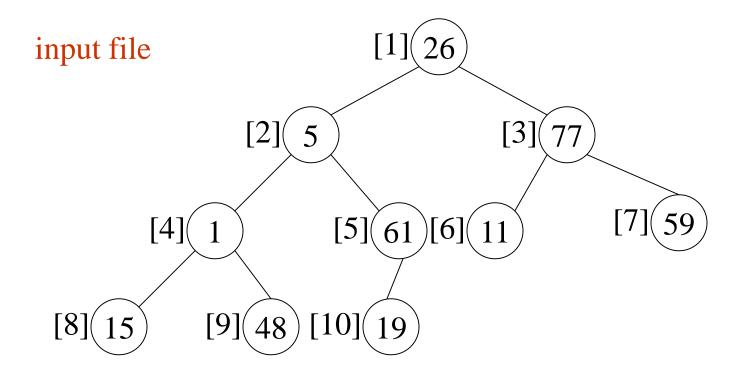

```
/* 將其餘的記錄附接至最後的鏈結*/ first is exhausted.
if(last1 == 0) link[lastResult] = last2;
else link[lastResult] = last1; second is exhausted.
return link[0];
```

 $O(n\log_2 n)$

#### \*Figure 7.7: Max heap following first for loop of *heapsort*

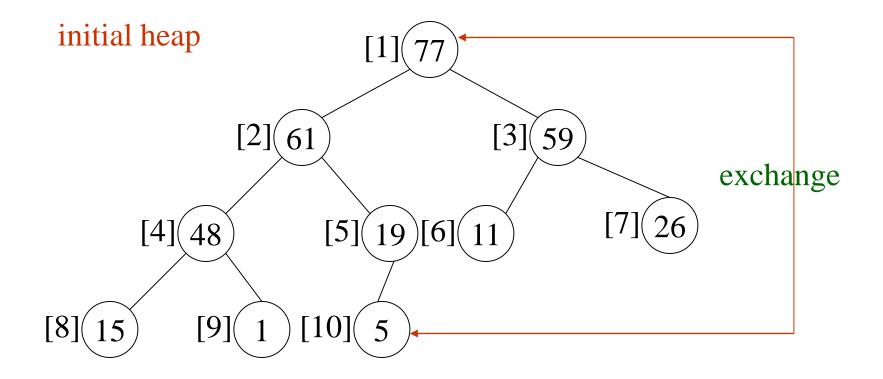

Figure 7.8: Heap sort example

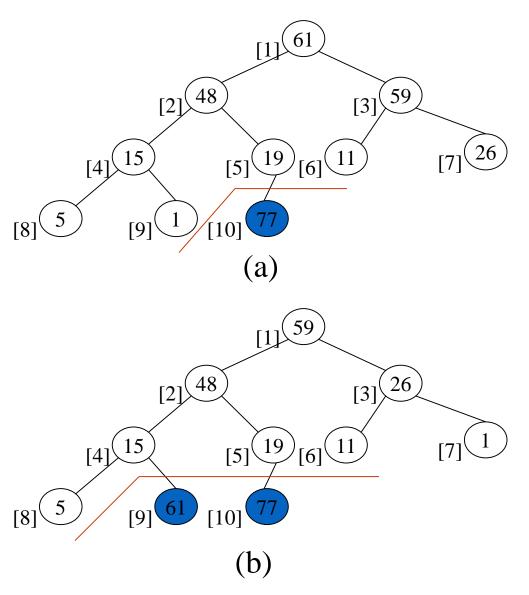

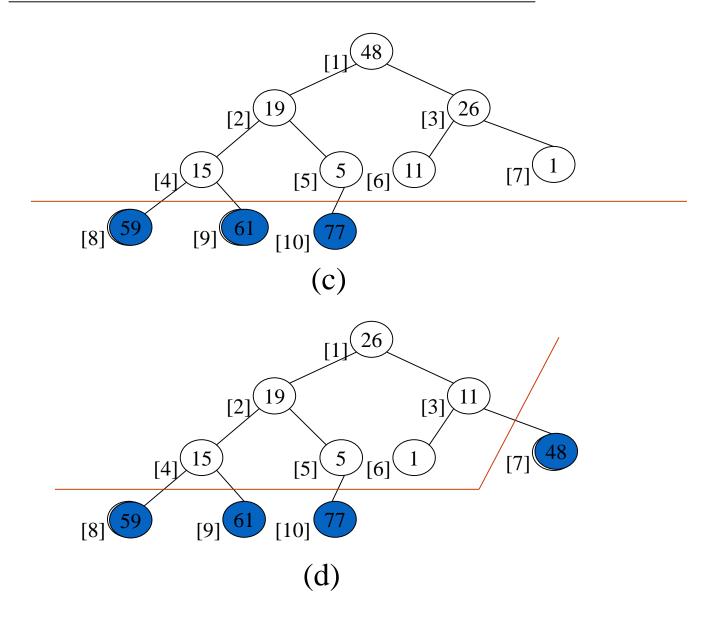

Figure 7.8(continued): Heap sort example

```
void adjust(element a[], int root, int n)
  int child, rootkey; element temp;
  temp=a[root]; rootkey=a[root].key;
  child=2*root; //左子樹
  while (child <= n)
    if ((child < n) &&
        (a[child].key < a[child+1].key))</pre>
           child++;
    if (rootkey > a[child].key)
    /*比較樹根和最大子樹*/
     break;
    else {//move to parent
      a[child/2] = a[child];
                                       2i+1
      child *= 2;
  a[child/2] = temp;
```

```
void heapsort(element a[], int n)
{ ascending order (max heap)
    int i, j;
    element temp;
                              bottom-up
    for (i=n/2; i>0; i--)
       adjust(a, i, n);
    for (i=n-1; i>0; i--) { top-down n-1 cylces
         SWAP(a[1], a[i+1], temp);
        adjust(a, 1, i);
```

- •實作heap sort排序10個數字
- ●實作步驟
- 1. 取得要排序的數字
- 2. 將這些數字畫成一個二元樹
- 3. 使二元樹中的所有root都是最大值
- 4. 最大值與最後一個節點交換
- 5. 重複3,4直到排序完成

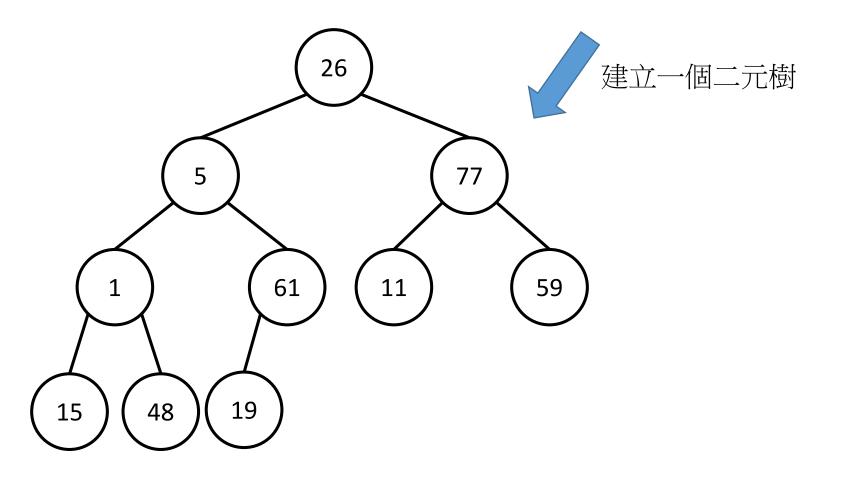

• 未排序的10個數字

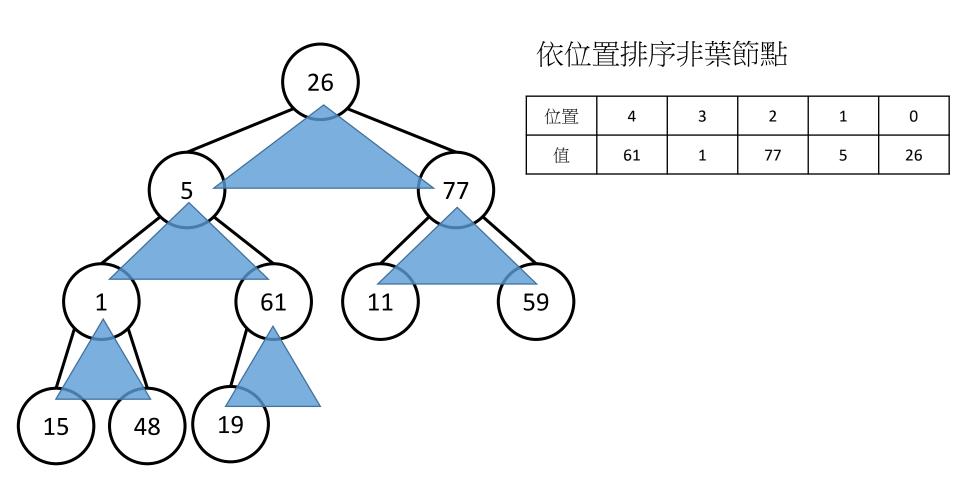

| init   26   5   77   1   61   11   59   15   4 | 8 19 |
|--|------|
|--|------|

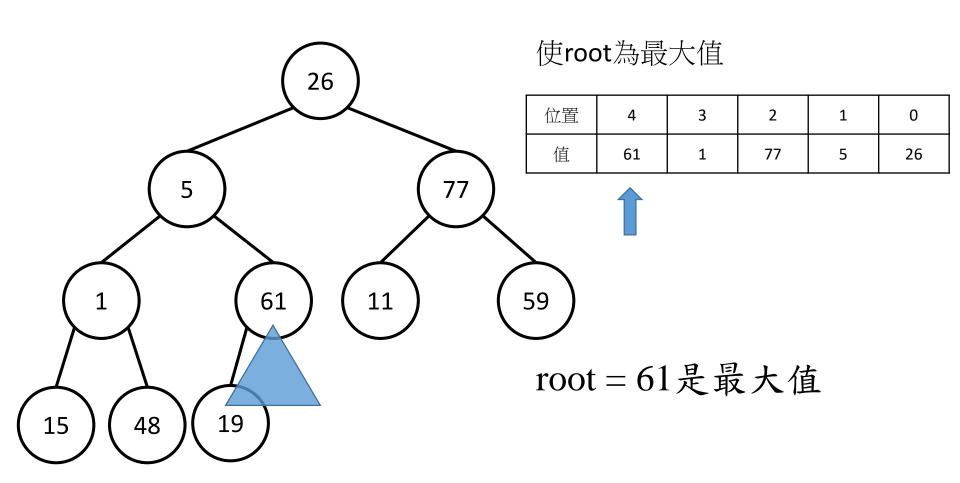

- 已排序的數字
- 未排序的數字

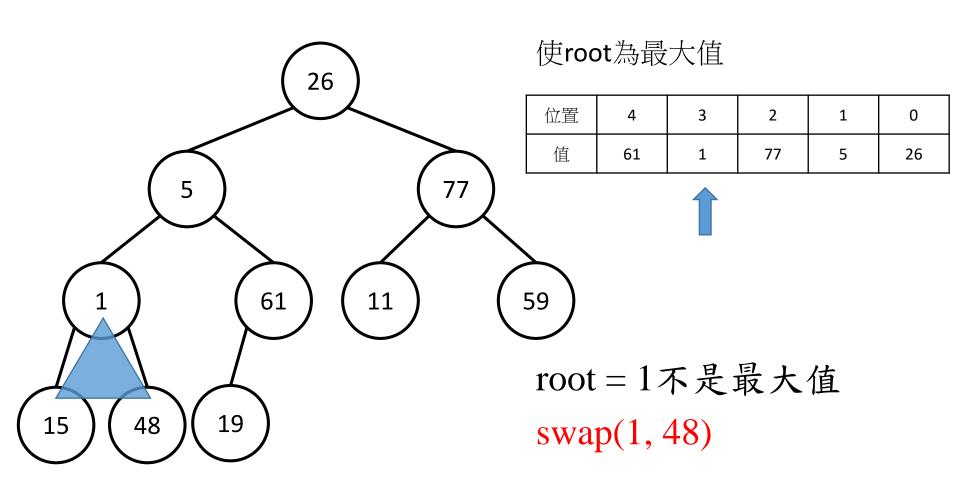

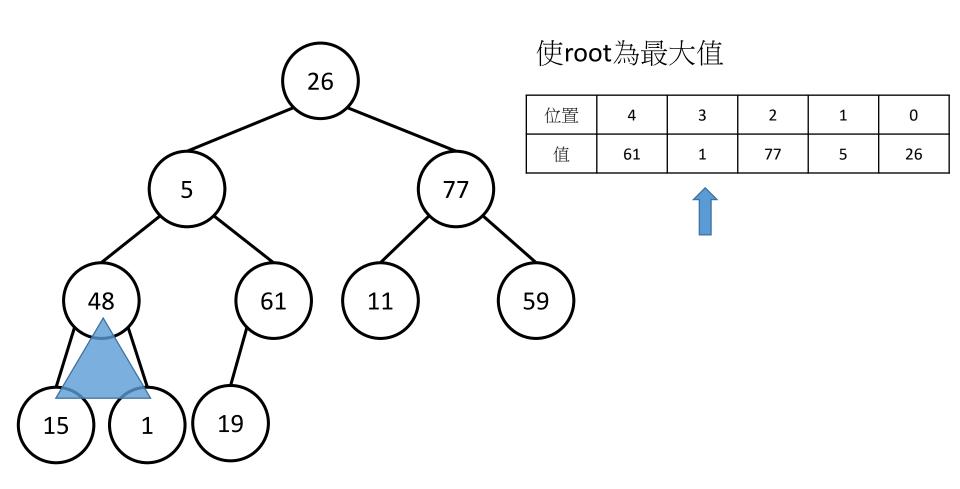

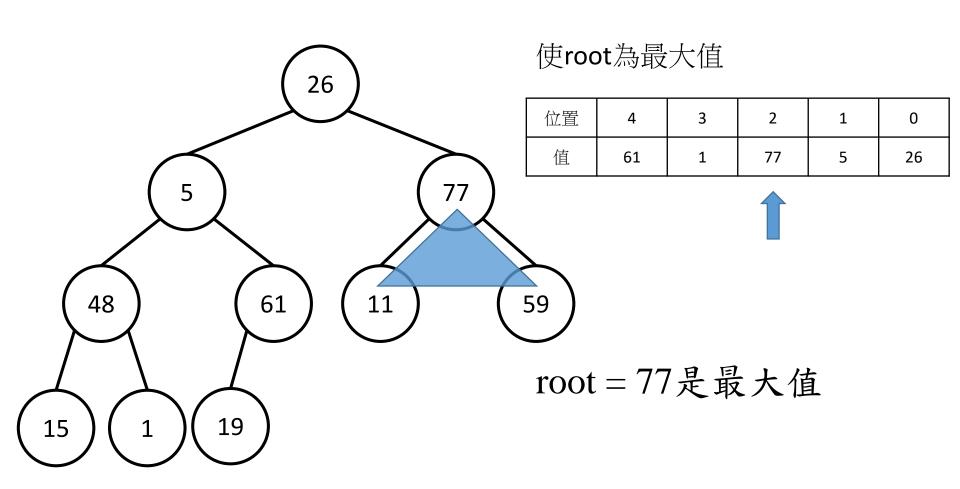

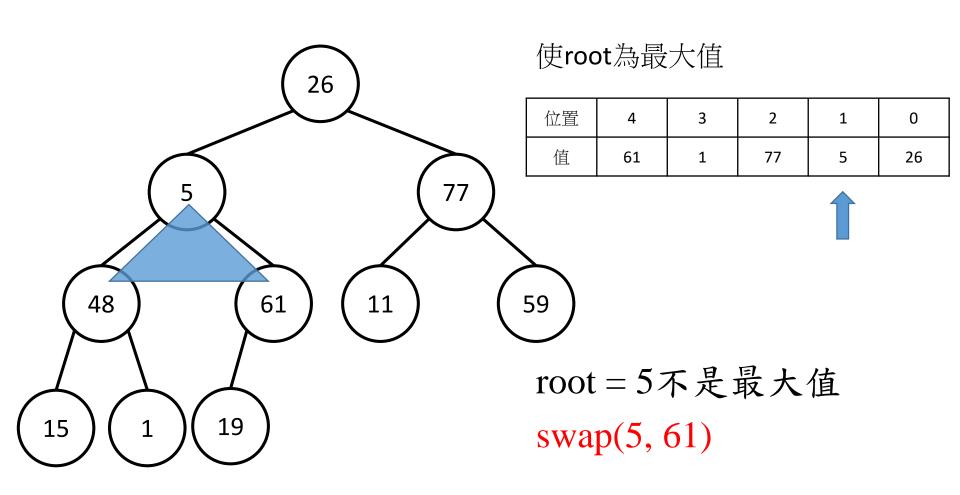

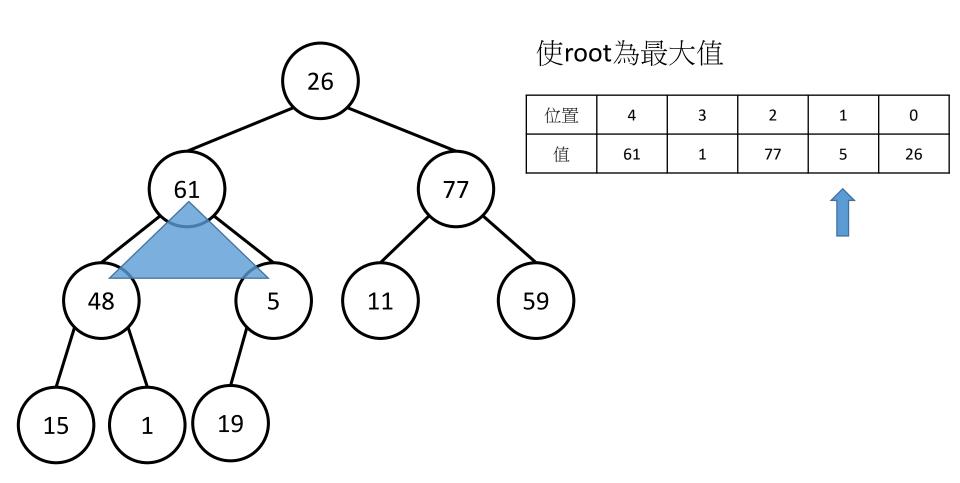

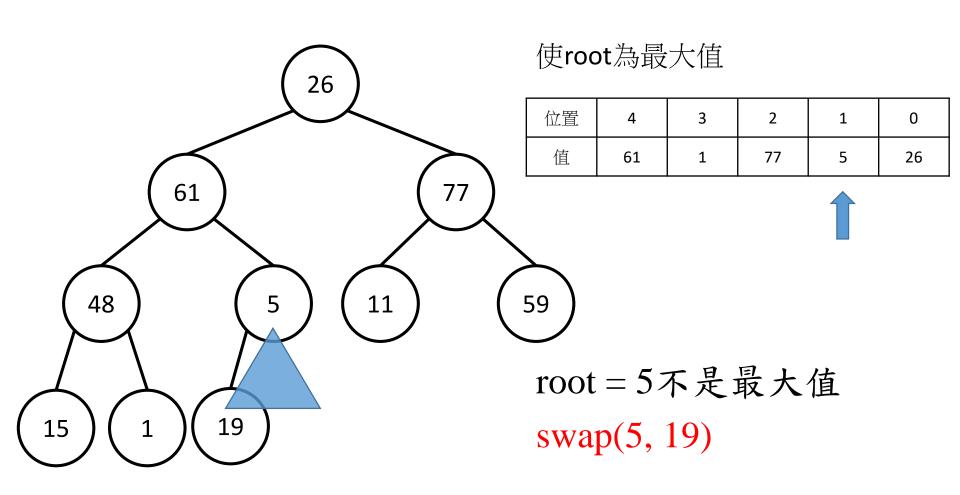

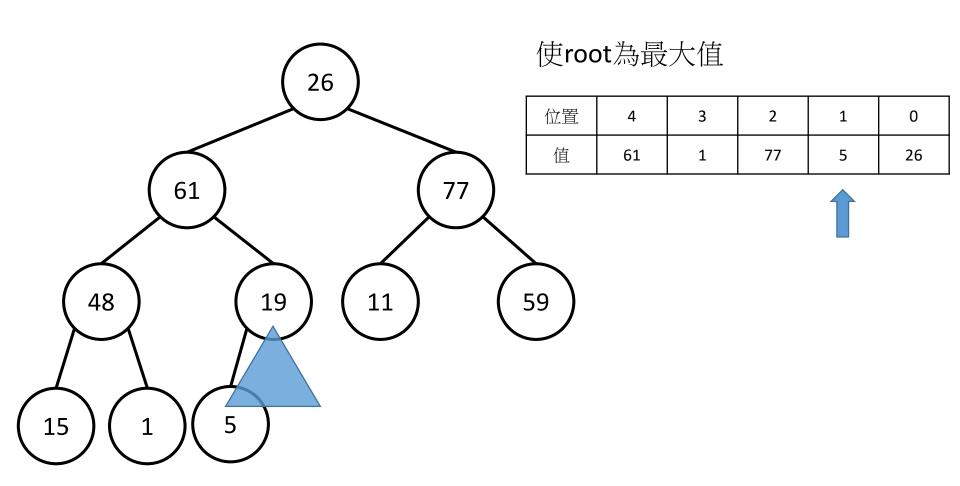

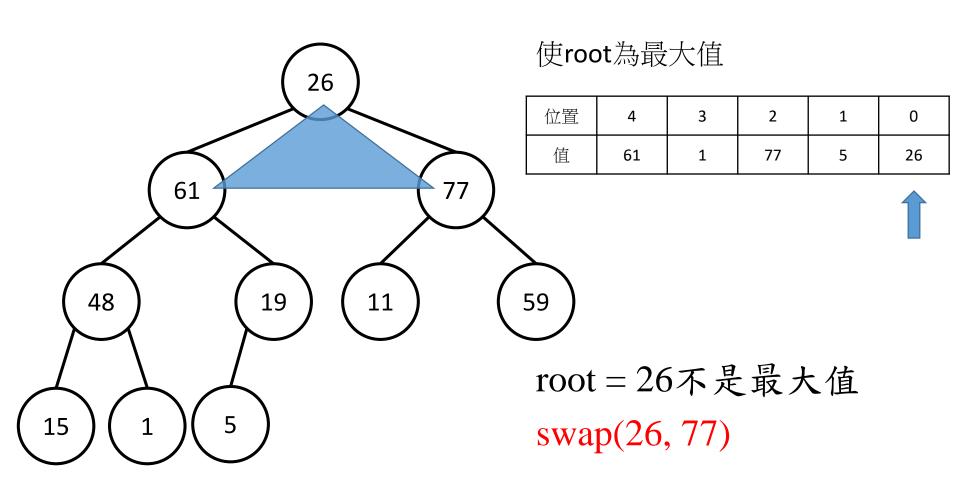

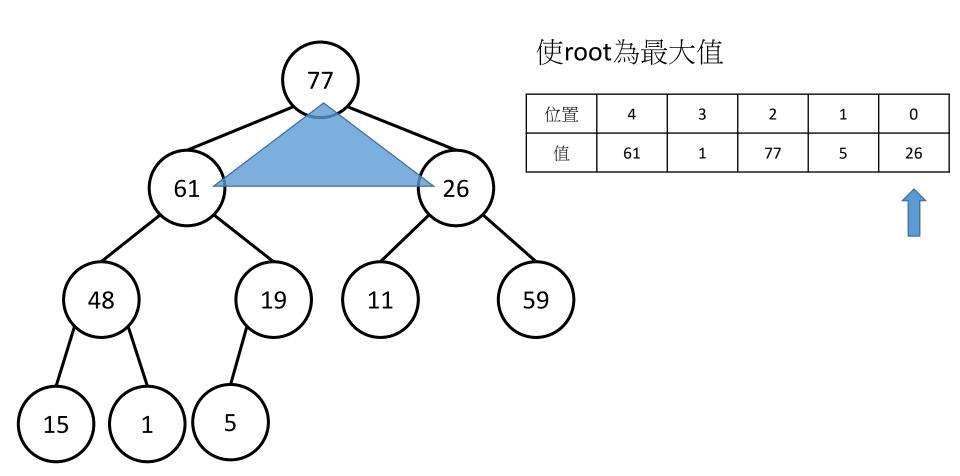

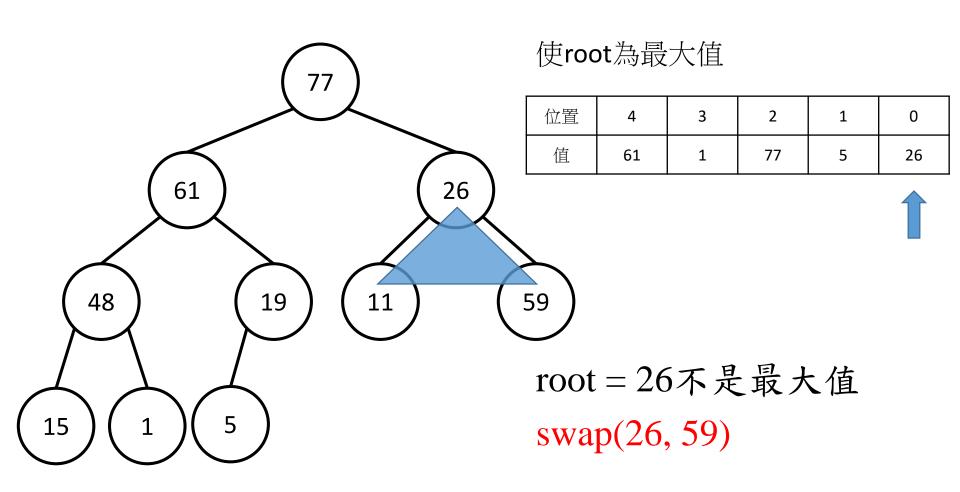

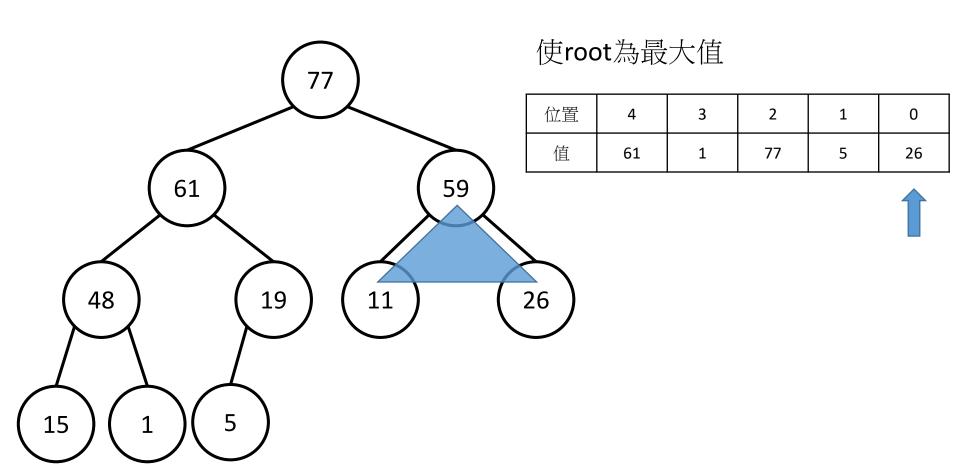

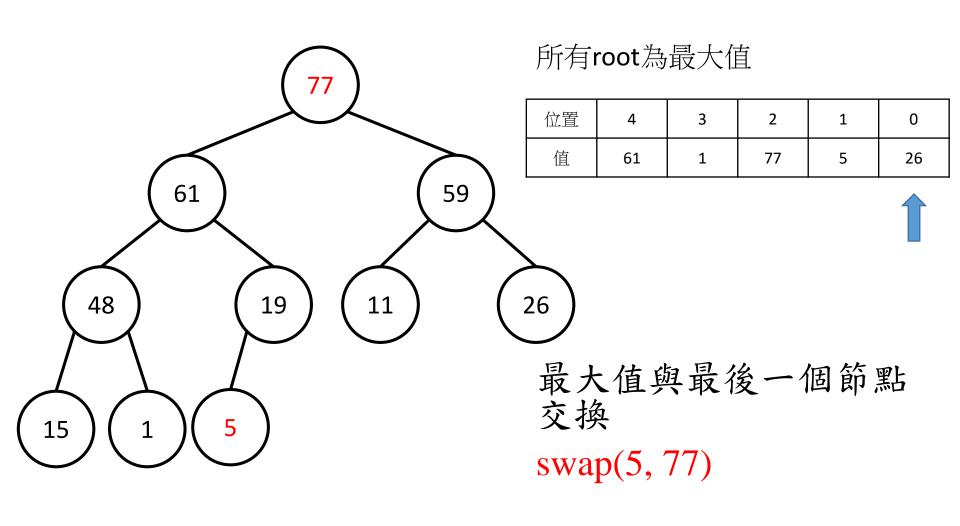

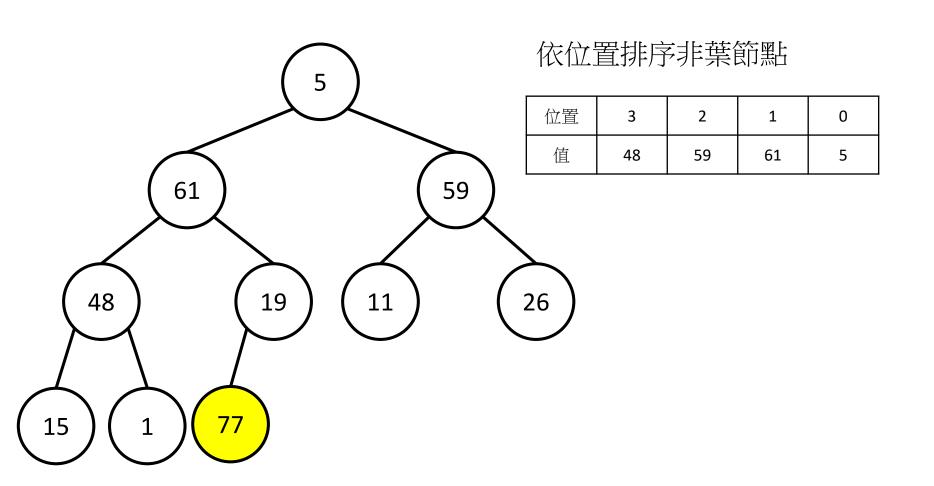

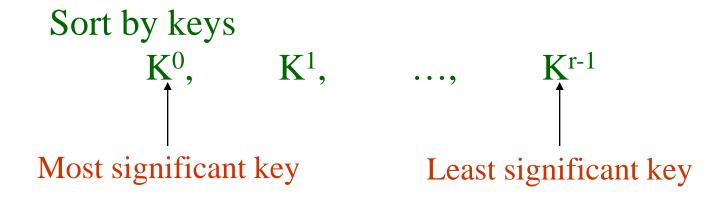

#### Radix Sort

 $R_0, R_1, \ldots, R_{n-1}$  are said to be sorted w.r.t.  $K_0, K_1, \ldots, K_{r-1}$  iff

$$(k_i^0, k_i^1, \dots, k_i^{r-1}) \le (k_{i+1}^0, k_{i+1}^1, \dots, k_{i+1}^{r-1})$$
  $0 \le i < n-1$ 

Most significant digit first: sort on K<sup>0</sup>, then K<sup>1</sup>, ... with respect to

Least significant digit first: sort on K<sup>r-1</sup>, then K<sup>r-2</sup>, ...

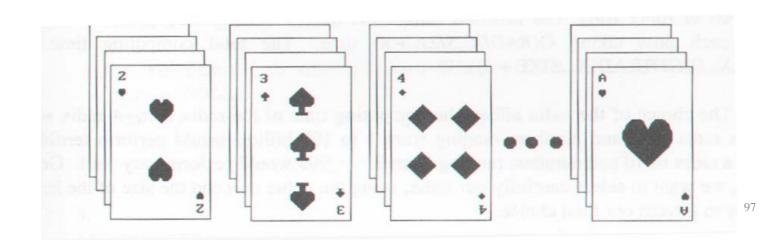

Figure 7.14: Arrangement of cards after first pass of an MSD sort

Suits: ♣ < ♦ < ♥ < ♠

Face values: 2 < 3 < 4 < ... < J < Q < K < A

Figure 7.15: Arrangement of cards after first pass of LSD sort

- (1) MSD sort first, e.g., bin sort, four bins ♣ ♦ ♥ ♠ LSD sort second, e.g., insertion sort
- (2) LSD sort first, e.g., bin sort, 13 bins 2, 3, 4, ..., 10, J, Q, K, A

  MSD sort, e.g., bin sort four bins ♣ ◆ ♥ ♠

## Radix Sort

$$0 \le K \le 999$$

$$(K^{0}, K^{1}, K^{2})$$

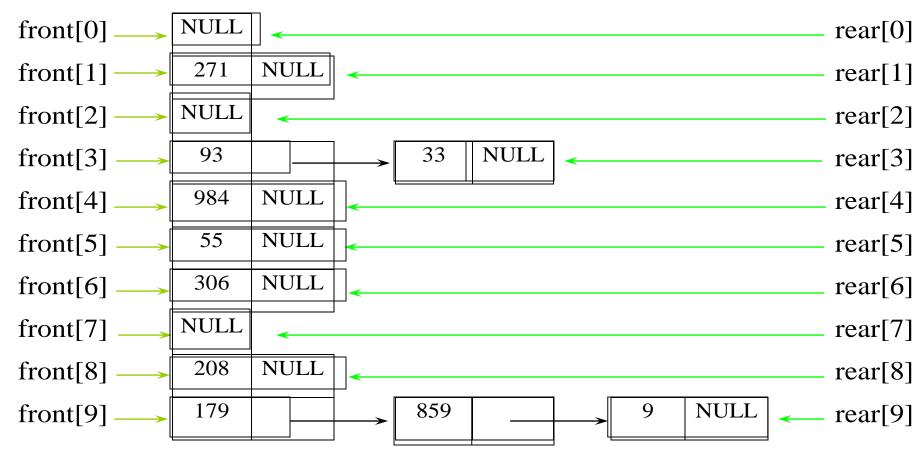

$$MSD \qquad LSD$$

$$0-9 \qquad 0-9 \qquad 0-9$$

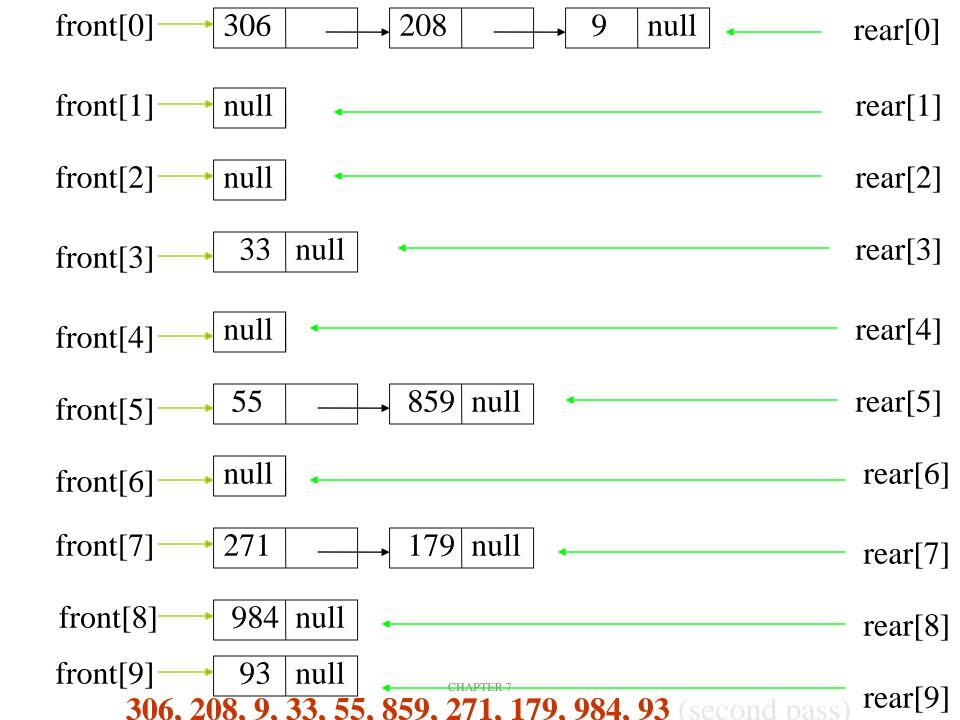

## Example for LSD Radix Sort

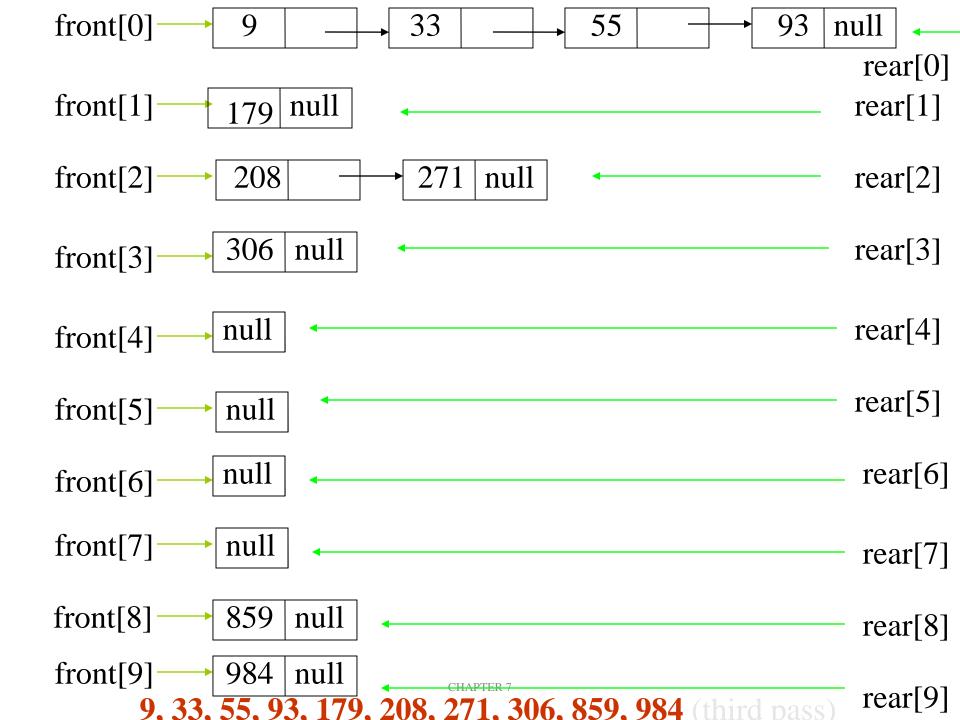

d (digit) = 3, r (radix) = 10 ascending order

179, 208, 306, 93, 859, 984, 55, 9, 271, 33

271, 93, 33, 984, 55, 306, 208, 179, 859, 9 After the first pass

#### Data Structures for LSD Radix Sort

```
\square An LSD radix r sort,
\square R_0, R_1, ..., R_{n-1} have the keys that are d-tuples
  (x_0, x_1, ..., x_{d-1})
#define MAX DIGIT 3
#define RADIX SIZE 10
typedef struct list node *list pointer;
typedef struct list_node {
     int key[MAX_DIGIT];
     list pointer link;
```

```
int front[r], rear[r]; /*佇列的開頭和結尾指標*/
int i, bin, current, first, last;
/*建立一個從first開始的記錄起始鏈*/
first = 1;
for( i = 1; i < n; i++) link[i] = i+1;
link[n] = 0;
for( i = d-1; i>=0; i--)
{    /*根據第i位數來排序*/
    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*    /*
```

```
for(current = first; current; current = link[current])
        /*把記錄放到佇列/容器中*/
        bin = digit(a[current], i, r);
         if( front[bin] == 0) front[bin] = current;
         else link[rear[bin]] = current;
        rear[bin] = current;
         /*找出第一個非空的佇列/容器*/
   for(bin = 0; !front[bin]; bin++);
   first = front[bin]; last = rear[bin];
         /*連接其餘的佇列*/
   for(bin++; bin < r; bin++)</pre>
         if(front[bin])
           link[last] =front[bin]; last = rear[bin];}
           link[last] = 0;
return first;
```

# Practical Considerations for Internal Sorting

- Data movement
  - slow down sorting process
  - •insertion sort and merge sort → linked file
- Perform a linked list sort + rearrange records

## List and Table Sorts

- Many sorting algorithms require <u>excessive</u> <u>data movement</u> since we must physically move records following some comparisons
  - If the records are large, this slows down the sorting process
- We can reduce data movement by using a linked list representation

#### List and Table Sorts

☐ However, in some applications, we <u>must</u> <u>physically rearrange the records</u> so that they are in the required order

■ We can achieve considerable savings by first performing a linked list sort and then physically rearranging the records according to the order specified in the list.

## Rearranging Sorted Linked List (1)

#### Sorted linked list, first=4

| i     | $R_1$ | $R_2$ | $R_3$ | $R_4$ | $R_5$ | $R_6$ | $R_7$ | $R_8$ | $R_9$ | R <sub>10</sub> |
|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-----------------|
| key   | 26    | 5     | 77    | 1     | 61    | 11    | 59    | 15    | 48    | 19              |
| linka | 9     | 6     | 0     | 2     | 3     | 8     | 5     | 10    | 7     | 1               |

#### Add backward links to become a doubly linked list, first=4

| i     | $R_1$ | $R_2$ | $R_3$ | $R_4$ | $R_5$ | $R_6$ | $R_7$ | R <sub>8</sub> | $R_9$ | R <sub>10</sub> |
|-------|-------|-------|-------|-------|-------|-------|-------|----------------|-------|-----------------|

```

CHAPTER 7

#### Table Sort

- The list-sort technique is not well suited for quick sort and heap sort.
- One can maintain an auxiliary table, t, with one entry per record, an indirect reference to the record.
- Initially, t[i] = i. When a swap are required, only the table entries are exchanged.
- After sorting, the list a[t[1]], a[t[2]], a[t[3]]...are sorted.
- Table sort is suitable for all sorting methods.

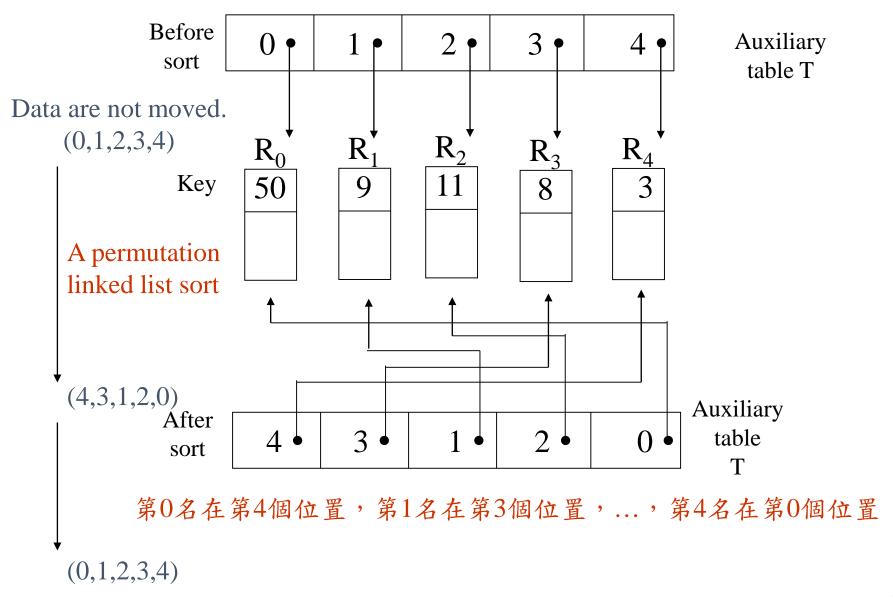

# Permutation Cycle

After sorting (nondecreasing):

|     | $R_1$ | $R_2$ | $R_3$ | $R_4$ | $R_5$ | $R_6$ | $R_7$ | $R_8$ |
|-----|-------|-------|-------|-------|-------|-------|-------|-------|
| key | 35    | 14    | 12    | 42    | 26    | 50    | 31    | 18    |
| t   | 3     | 2     | 8     | 5     | 7     | 1     | 4     | 6     |

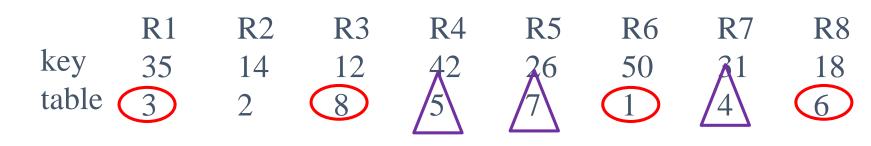

- Permutation [3 2 8 5 7 1 4 6]
- Every permutation is made up of disjoint permutation cycles:
  - (1, 3, 8, 6) nontrivial cycle
    - R1 now is in position 3, R3 in position 8, R8 in position 6, R6 in position 1.
  - (4, 5, 7) nontrivial cycle
  - (2) trivial cycle

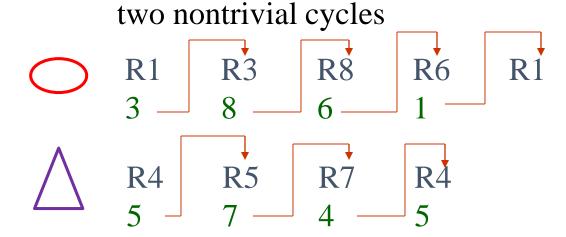

#### Table Sort

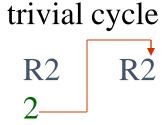

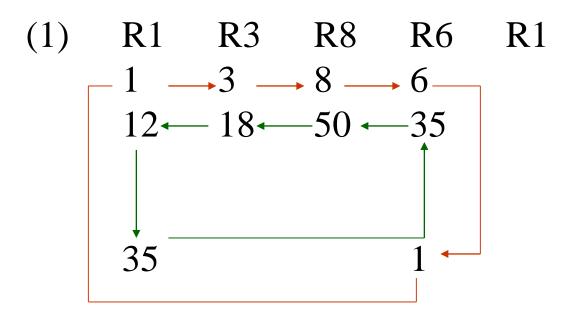

## Every permutation is made of disjoint cycles.

#### Example

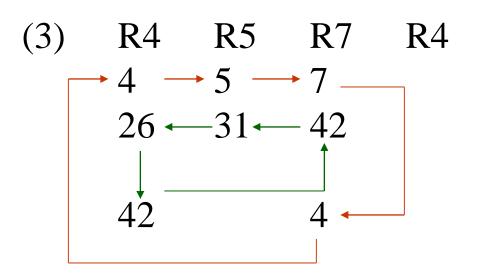

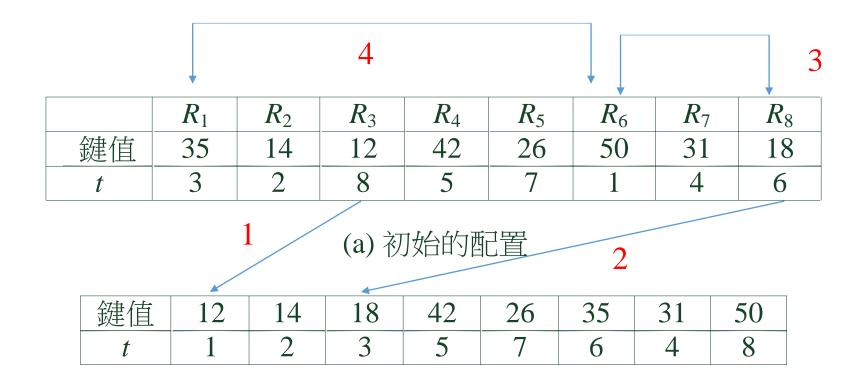

(2) 
$$i=1,2$$
  $t[i]=i$ 

#### (b) 第一個迴路重新排列後的配置

| 鍵值 | 12 | 14 | 18 | 26 | 31 | 35 | 42 | 50 |
|----|----|----|----|----|----|----|----|----|
| t  | 1  | 2  | 3  | 4  | 5  | 6  | 7  | 8  |

(c) 第二個迴路重新排列後的配置

### Table Sort

```
yoid tableSort(element a[], int n, int t[])
  /* 重新排列a[1:n]成序列a[t[1]], ..., a[t[n]]
    int i, current, next;
                                                            26
   element temp;
   for (i = 1; i < n; i++)
          temp = a[i]; current = i;
do {
             tlcurrent;
current = next;
while (t[current] != i);
current] = temp;
current = current;
```

### Summary of Internal Sorting

- •No one method is best under all circumstances.
  - Insertion sort is good when the list is already partially ordered. And it is the best for small *n*.
  - Merge sort has the best worst-case behavior but needs more storage than heap sort.
  - Quick sort has the best average behavior, but its worst-case behavior is  $O(n^2)$ .
  - The behavior of Radix sort depends on the size of the keys and the choice of r.

# Complexity of Sort

|                | stability | space   | time     |          |          |
|----------------|-----------|---------|----------|----------|----------|
|                |           |         | best     | average  | worst    |
| Bubble Sort    | stable    | little  | O(n)     | O(n2)    | O(n2)    |
| Insertion Sort | stable    | little  | O(n)     | O(n2)    | O(n2)    |
| Quick Sort     | untable   | O(logn) | O(nlogn) | O(nlogn) | O(n2)    |
| Merge Sort     | stable    | O(n)    | O(nlogn) | O(nlogn) | O(nlogn) |
| Heap Sort      | untable   | little  | O(nlogn) | O(nlogn) | O(nlogn) |
| Radix Sort     | stable    | O(np)   | O(nlogn) | O(nlogn) | O(nlogn) |
| List Sort      | ?         | O(n)    | O(1)     | O(n)     | O(n)     |
| Table Sort     | ?         | O(n)    | O(1)     | O(n)     | O(n)     |

| n    | 插入     | 堆積    | 合併         | 快速    |           |                  |

### **External Sorting**

- The lists to be sorted are too large to be contained totally in the internal memory.
  - So internal sorting is impossible.
- The list (or file) to be sorted resides on a disk.
- Block: unit of data read from or written to a disk at one time. A block generally consists of several records.
- Read/write time of disks:
  - seek time (搜尋時間):把讀寫頭移到正確磁軌(track, cylinder)
  - latency time (延遲時間):把正確的磁區(sector)轉到讀寫 頭下
  - transmission time (傳輸時間):把資料區塊傳入/讀出磁碟

### Merge Sort as External Sorting

- The most popular method for sorting on external storage devices is merge sort.
- Phase 1: Obtain sorted runs (segments) by internal sorting methods, such as heap sort, merge sort, quick sort or radix sort. These sorted runs are stored in external storage.
- Phase 2: Merge the sorted runs into one run with the merge sort method.

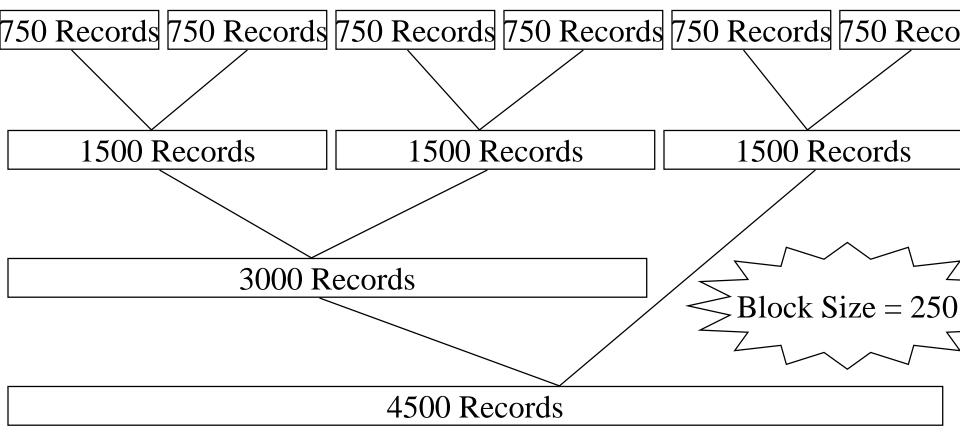

File: 4500 records, A1, ..., A4500

internal memory: 750 records (3 blocks)

block length: 250 records

input disk vs. scratch pad (disk)

- (1) sort three blocks at a time and write them out onto scratch pad
- (2) three blocks: two input buffers & one output buffer

# Time Complexity of External Sort

### input/output time

- $\Box t_s = \text{maximum seek time}$
- $\Box t_l = \text{maximum latency time}$
- $\Box t_{rw}$  = time to read/write one block of 250 records

$$t_{IO} = t_s + t_l + t_{rw}$$

#### cpu processing time

- $\Box$  *tis* = time to internally sort 750 records
- $\square nt_m$  = time to merge n records from input buffers to the output buffer

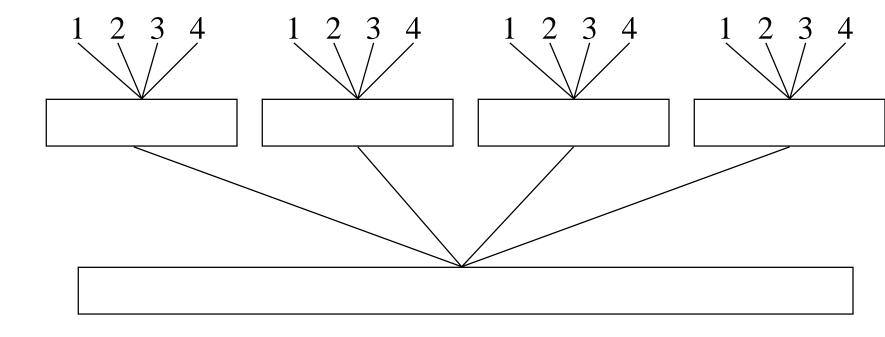

#### Block Size = 250

| 運算                               | 時間                                     |
|----------------------------------|--|
| (1)從輸入讀取18個區塊18t <sub>IO</sub> , | 36t <sub>IO</sub> + 6t <sub>IS</sub>   |
| 內部排序 6t <sub>IS</sub> ,寫入18個區塊   |  |
| 18t <sub>IO</sub> °              |  |
| (2) 兩兩合併串連1到6 (總共18              | 36t <sub>IO</sub> + 4500t <sub>m</sub> |
| 個區塊, 4500記錄)                     |  |
| (3) 合併兩個1500筆記錄,共12              | $24t_{10} + 3000t_{m}$                 |
| 個區塊                              |  |
| (4) 把一個有3000筆記錄的串連               | 36t <sub>IO</sub> + 4500t <sub>m</sub> |
| 和一個有1500筆記錄的串連                   |  |
| 合併在一起 (4500/250 = 18)            |  |
| 總時間                              | $132t_{IO} + 12,000t_{m} + 6t_{IS}$    |

### Consider Parallelism

- ☐ Carry out the CPU operation and I/O operation in parallel
- $\Box 132 \ t_{IO} = 12000 \ t_m + 6 \ t_{IS}$
- ☐ Two disks: 132 *tio* is reduced to 66 *tio*

# K-Way Merging

A 4-way merge on 16 runs

2 passes (4-way) vs. 4 passes (2-way)

# Analysis

- $\lceil \log_k m \rceil$  passes  $\rceil$  O( $n \log_2 k * \log_k m$ )
- 1 pass:  $\lceil n \log_2 k \rceil$ ; n: number of compared, k: k way
- I/O time vs. CPU time
  - reduction of the number of passes being made over the data
  - efficient utilization of program buffers so that input, output and CPU processing is overlapped as much as possible
  - run generation
  - run merging
